

Noah's Report

WEEKLY STUDENT PERFORMANCE & EVIDENCE LOG

Week 1

Evidence URL: <https://drive.google.com/open?id=1rG2bStyYsxx5Gko4FuBLyAHMN2NFhxd0>

Noah was introduced to the basics of programming, where he explored Python syntax, variables, and simple operations. He built a solid foundation for problem-solving and showed good understanding of fundamental programming concepts.

Week 2

Evidence URL: <https://drive.google.com/file/d/1L0hBD14vEov7ZrTpsOAV9z0kaG5UaBMY/view?usp=drivesdk>

Noah had some experience in Python, but he needed a recap of conditionals. He also had some trouble understanding concepts and tasks, but he managed to pull through.

Week 3

Evidence URL: https://drive.google.com/open?id=1GjIRTR9wJr_g8F9tN20oSPLq7-aLSLMh

Noah did well to grasp the fundamentals of loops and he used that knowledge to complete the class activity

Week 4

Evidence URL: *No evidence link provided*

Noah learned how to define and use functions to structure his code efficiently. He practiced building reusable functions, enhancing the organization and readability of his programs while demonstrating steady progress in his understanding

Week 6

Evidence URL: <https://drive.google.com/open?id=1By0GMjwmBEFvTPrpdcfQP3SGCiFPjF2e>

During the in-class activity, he successfully managed to develop his own custom class and object, effectively showcasing the knowledge he gained throughout the session. While he navigated the more

complex logic with some guided assistance, his ability to apply these abstract concepts to create a functional, independent code structure highlights a significant step forward in his programming journey.

Week 7

Evidence URL: https://drive.google.com/open?id=1-DbZXzUMzHRt0xwe9r6SHhpWg_Wt1F7c

Noah has truly excelled in mastering the essential building blocks of the web, demonstrating a solid command of HTML structure and CSS styling. During the in-class activity, he successfully managed to develop his own educational webpage on different frog species, effectively showcasing the knowledge he gained throughout the session by expertly organizing repeated image-and-text modules. While he navigated the consistent formatting and asset layout with some guided assistance, his ability to translate these foundational concepts into a clean, comprehensive, and visually consistent vertical gallery highlights a significant step forward in his web development journey.

Week 9

Evidence URL: <https://drive.google.com/open?id=1T02Y8GJRPi99OYrbRuMhyVNoeoTKNmLS>

Noah has made excellent progress in understanding the fundamentals of web development and JavaScript programming. During the in-class activity, he successfully created a simple developer portfolio webpage while applying key concepts such as HTML structure, headings, paragraphs, variables, arrays, objects, and console outputs. His work shows a good grasp of how JavaScript can be used to store and display different types of information, which is an important foundation for building more interactive web applications. Well done, Noah! 🌟

Week 10

Evidence URL: *No evidence link provided*

Noah has shown great creativity and confidence in applying the fundamentals of Figma during the in-class activity. He successfully created a visually engaging character-based design featuring Monkey D. Luffy, using images, text, layout, and layering to build an attractive composition. His work also shows a good understanding of visual storytelling, as he combined background imagery, character placement, and profile-style information to make the design feel more dynamic and polished. This is a strong start in developing digital design and prototyping skills. Well done, Noah! 🌟

Week 11

Evidence URL: <https://drive.google.com/open?id=1dILxRIZknVOVKIoK5PqmyFkIMOgSIPLj>

Noah has shown strong progress in learning how to use GitHub to manage and showcase his web development work. During the in-class activity, he successfully created a GitHub repository for his frog-themed website, uploaded key project files such as HTML, CSS, and README documentation, and demonstrated an understanding of commits and project organization. His work shows that he is beginning to build important developer habits, including saving code properly, documenting projects, and presenting his work in a professional way. Well done, Noah! 🌟

Week 12

Evidence URL: https://drive.google.com/open?id=1oTCubIthfM8QvjZudgJoxwd7Tthn_SA

Noah has shown strong progress in learning how to use Flask and Python to develop backend APIs. During the in-class activity, he successfully built a web endpoint to serve dynamic content, structured data properly using JSON formatting, and utilized built-in libraries to implement logical features like randomly selecting items. His work shows that he is beginning to build important developer habits, including writing clean route structures, understanding server-side data handling, and constructing standard API responses. Well done, Noah! 🌟

Week 13

Evidence URL: <https://drive.google.com/open?id=19m2CCR6dhX4rmoTDxkW0dGwsVUcwfDF>

Noah has shown strong progress in learning how to implement dynamic features in backend APIs using Flask. During the in-class activity, he successfully created a weather endpoint that handles user input by extracting query parameters from incoming requests. He demonstrated an excellent understanding of server-side data handling, using dictionary methods to provide fallback defaults when a requested city isn't found and returning structured JSON responses. His work shows that he is beginning to build important developer habits, including configuring a local server environment, managing dynamic API inputs, and designing predictable, data-driven endpoints. Well done, Noah! 🌟

Week 14

Evidence URL: <https://drive.google.com/open?id=132TcLrYu74RCuhDIM9uA-NVpn001t9Mi>

Noah has shown an incredible start to his journey with databases, successfully learning the core fundamentals of SQL basics using SQLite! During the in-class activity, he took his very first steps into database management by learning how a table is structured with columns and specific data types. He then successfully wrote and executed foundational commands to create a table from scratch, insert real data records, remove specific entries, and query his dataset to view the results. His work shows that he is quickly grasping how data is organized and manipulated behind the scenes, building essential

developer habits around syntax precision and structured thinking. This is an excellent foundation for his first time working with databases—well done, Noah! 🌟

Week 15

Evidence URL: https://drive.google.com/open?id=152rpiA06DEEIqnAUZWRkDRJBVEWaM_Yu

Noah has shown great adaptability by taking his database skills a step further and learning how to execute SQL queries directly inside DB Browser for SQLite! During the in-class activity, he transitioned from just looking at data to actively retrieving it, navigating to the "Execute SQL" workspace to write and run custom database commands. He practiced querying his Hero_Trivia table, learning how to use essential syntax to pull specific information from his datasets. His work shows that he is building excellent developer habits, including using professional database tools to test and refine queries, validating data results in real time, and mastering the fundamentals of data interaction. Fantastic effort, Noah! 🌟

Week 17

Evidence URL: *No evidence link provided*

Noah has reached an exciting milestone by transitioning from theory to practice, diving directly into the implementation of the Client-Server Model! During the in-class activity, he took on the role of a full-stack developer, connecting an interactive HTML frontend client to a live Flask backend server powered by a relational SQLite database. He did a fantastic job breaking down and implementing the mechanics of Section 1 (Get Random Trivia). Noah explained and demonstrated exactly how a user trigger on the client side initiates an asynchronous JavaScript fetch() request to the /randomtrivia endpoint, how the server receives that call to execute a database query against trivia_db.db, and how the system packages the response into JSON to dynamically update the webpage. His work shows he is building superb developer habits, including writing organized backend routing code, handling data lifecycles across separate application layers, and confidently articulating how modern web architecture functions. Incredible growth, Noah! 🌟

Week 18

Evidence URL: *No evidence link provided*

Noah has shown fantastic progress by successfully implementing and explaining the mechanics of Section 2 (Get Trivia for a Specific Superhero)! During this part of the activity, he took his understanding of the Client-Server Model a step further by introducing dynamic user input into the workflow. He did an excellent job demonstrating how a user's text input on the frontend is captured and passed as a dynamic parameter through an asynchronous fetch() request. He explained how the Flask backend extracts this

variable from the URL path and securely uses it to query the trivia_db.db database using parameterized SQL queries to prevent security issues. Finally, he traced how the server handles both success states and 404 errors if a superhero isn't found, sending the appropriate JSON response back to the client interface. His implementation highlights strong developer habits, including managing dynamic API routing, safely querying databases based on user input, and handling edge cases to ensure a smooth user experience. Terrific work, Noah! 🌟

Week 19

Evidence URL: <https://drive.google.com/open?id=1tFGRcfirDjt3HmyppITQdv4RXejWFxyK>

Noah has shown fantastic progress by successfully implementing and explaining the mechanics of the Quiz Mode section! During this part of the activity, he demonstrated a strong grasp of advanced full-stack workflows by handling dual HTTP methods (GET and POST) on a single /quiz endpoint.

On the frontend, Noah efficiently built out interactive controls to fetch questions, capture user input, and track the game state dynamically by maintaining a running session score. He did an excellent job managing the asynchronous lifecycle, showing how a GET request retrieves a random challenge from the SQLite database while safely hiding the correct answer from the client side to maintain the integrity of the quiz.

When a user submits a guess, Noah's implementation flawlessly packages the data into a JSON payload and dispatches it via a POST request. He demonstrated great attention to backend reliability by extracting the input, executing case-insensitive string comparisons against the database record, and returning clean validation states (Correct! or Incorrect) back to the UI. His implementation highlights strong developer habits, including robust request validation, state synchronization between frontend scripts and backend routes, and practical error handling for a seamless, interactive user experience. Terrific work, Noah! 🌟
